

Documentation

For Project Highedge co., CISC327 Group 10.

Changed HTML Files and Description of Changes

1. *sell.html*

- Newly created file, used to create the page for which user redirected to when they successfully submitted sell ticket information. The page includes information of newly created ticket, a success message and a link to profile page.

2. *buy.html*

- Newly created file, used to create the page for which user redirected to when they successfully submitted buy ticket information. The page includes transaction information, a success message and a link to profile page.

3. *index.html*

- Modified template file, the original solution can't display ticket information in a table, and doesn't include required post form, thus added features to the solution to improve program functionality.

- New feature 1 : Added three post forms for user to submit ticket information, each was given a path so the post form can be submitted to correct URL. Also each form contains a messages on the top, which is used to tell user if the action succeed/failed.

- New feature 2 : Added a HTML table "current_tickets", used to display all ticket information.

- New feature 3 : Added js method "add_ticket()", which receives information of all ticket from frontend.py, processes those information and append to the table "current_tickets" so user can see information of all tickets in database.

- New feature 4 : Added the display of user's current balance.
